

Tempus Report Feature and Layout Stress Suite

Example Author

Template validation laboratory

October 3, 2026

ABSTRACT

This document exercises simple and complex report features, navigation, mathematics, artwork, and content spanning page boundaries. Independent fixtures cover title layouts and class options. All measurements and the bundled artwork are synthetic; this is a typesetting stress test rather than an experimental report.

1 Introduction

The purpose of this report is to expose typography and layout regressions while preserving a usable example of each feature. For example, Vaswani et al. (2017) introduced the Transformer architecture. Use a parenthetical citation when the reference supports a statement rather than forming part of the sentence (Vaswani et al., 2017).

2 Findings

The following examples establish the basic report building blocks. Refer to labeled objects with `\cref`, as in equation (1) and table 1, or start a sentence with `\Cref`. Figure 1 shows a placeholder for your artwork.

2.1 Equations and quantities

For measurements $x_1, \dots, x_n$, the sample mean is

$$\bar{x} = \frac{1}{n} \sum_{i=1}^n x_i. \quad (1)$$

Use `\qty` for a number with a unit, such as 12.3 ms, and `\num` for a formatted number, such as 10 000.

2.2 Tables

The S columns in table 1 align numbers on the decimal point. The entries are illustrative and should be replaced with your data.

Table 1. Illustrative measurements; lower latency is better.

Method	Latency (ms)	Accuracy (%)
Baseline	18.7	91.2
Candidate	12.3	92.5

2.3 Figures

Replace the path below with your own image. Until that file exists, `\reportimage` draws a placeholder without requiring external assets.

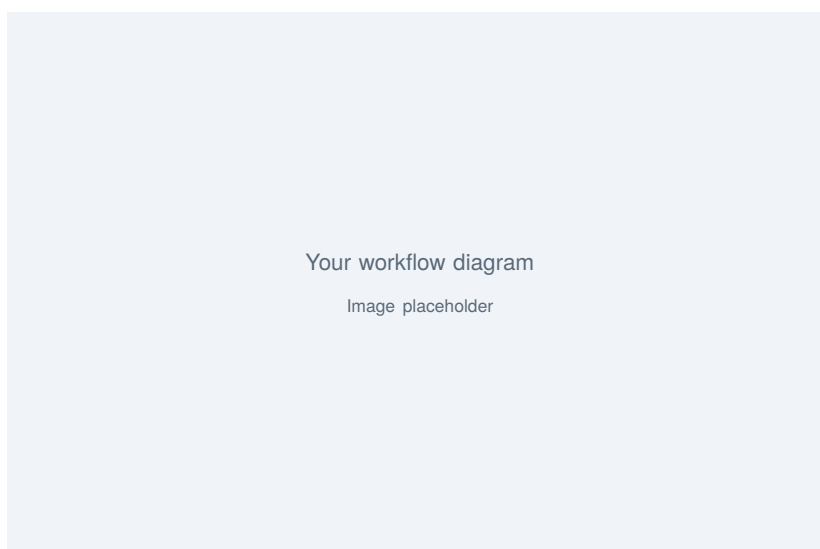

Figure 1. Illustrative workflow placeholder.

2.4 Scientific ML diagrams

Figure 2 illustrates supervised learning: a forward pass produces class probabilities, and backpropagation updates the trainable parameters. The diagram uses editable TikZ nodes and the class palette.

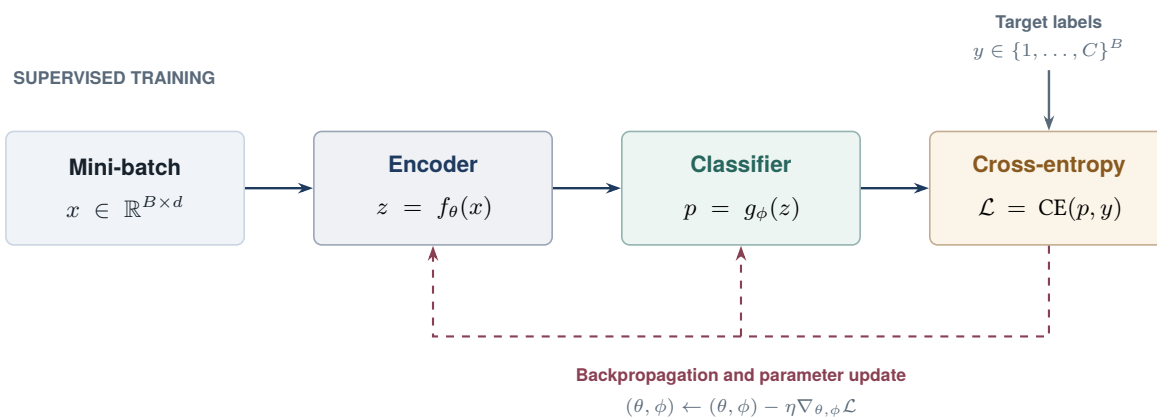

Figure 2. A mini-batch training step for a classifier with C classes. Solid arrows show the forward computation and label input; dashed arrows show gradient flow. B is the batch size, d the input dimension, and η the learning rate.

Key takeaway

State the main conclusion or recommended next step.

3 Methods and implementation

3.1 Callouts

Use a titled box for supporting context. The optional style selects a theme color; the title should also convey the purpose of the callout.

Practical tip

Keep the method and its implementation together so readers can compare the mathematical description with the executable code.

Numerical caution

The arithmetic mean is sensitive to outliers. Inspect the measurements before interpreting a single summary statistic.

3.2 Algorithms

Algorithm 1 describes the sample mean from equation (1). Algorithms use a floating caption, optional line numbers, and themed keywords. Place the label immediately after the caption.

Algorithm 1. Compute the sample mean.

Input: Measurements $x_1, \dots, x_n$ with $n > 0$

Output: Sample mean $\bar{x}$

```

1  $s \leftarrow 0$ 
2 for  $i \leftarrow 1$  to  $n$  do
3    $s \leftarrow s + x_i$ 
4 end for
5 return  $s/n$ 

```

▷ Running total

3.3 Code listings

The same calculation appears in listing 1. Listings provide syntax colors, line numbers, and automatic line wrapping without shell escape.

Listing 1. A minimal sample mean implementation.

```

1 def sample_mean(values):
2     """Return the arithmetic mean of a nonempty sequence."""
3     if not values:
4         raise ValueError("At least one measurement is required")
5     # Keep the example close to the pseudocode.
6     total = sum(values)
7     return total / len(values)

```

4 Text, structure, and navigation

4.1 Typography and characters

Roman text, **bold**, *italic*, *emphasis*, sans serif, monospace, and SMALL CAPITALS. Escaped characters: # \$ % & _ { }; accents: café, naïve, façade, Łukasz. Text symbols include \, ~, and ^. A footnote tests bottom-of-page placement.¹

4.1.1 Third-level heading

This level is numbered but omitted from the default contents depth.

Run-in heading. The paragraph follows on the same line.

- An outer bullet.
 - A nested bullet with inline math $a^2 + b^2 = c^2$.
 - * A third-level bullet.
 - A second outer bullet.
1. A numbered step.
 - (a) A nested numbered step.
 2. A second step.

Coverage Every supported feature receives a reproducible example.

Stress case Content deliberately crosses page boundaries.

A block quotation demonstrates margins and paragraph spacing. This is original example prose, rather than a quotation from an external source.

Links: a named link, and a wrapping URL: <https://example.org/reports/tempus/validation/a-long-path-with-several-components?configuration=stress-suite&version=1.5.0>. References: section 4, equation (2), table 2, figure 3, theorem 1, algorithm 2, and listing 2. Supplementary content is in appendices A and B. Citation variants: Vaswani et al., (2017), and (see Vaswani et al., 2017, Section 3). Multiple-entry citation: (Vaswani et al., 2017; Tempus Template Maintainers, 2026; Example and Müller, 2026). The latter two entries are explicitly synthetic bibliography-formatting tests, including a corporate author, an accented author name, and book metadata.

5 Advanced mathematics

$$f(x) = x^2 + 2x + 1, \quad (2a)$$

$$f'(x) = 2x + 2. \quad (2b)$$

$$\mathcal{J}(\theta) = \sum_{i=1}^n \|y_i - f_{\theta}(x_i)\|_2^2 + \lambda \|\theta\|_2^2. \quad (3)$$

¹A deliberately longer footnote with a citation (Vaswani et al., 2017) and an explanation of the illustrative data.

$$(a + b + c + d)^2 = a^2 + b^2 + c^2 + d^2$$

$$+ 2ab + 2ac + 2ad + 2bc + 2bd + 2cd. \quad (4)$$

$$A = \begin{pmatrix} 1 & 2 \\ 3 & 4 \end{pmatrix}, \quad B = \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}, \quad g(x) = \begin{cases} x^2, & x \geq 0, \\ -x, & x < 0. \end{cases}$$

$$\text{Var}(X) = \mathbb{E}[(X - \mathbb{E}X)^2], \quad \int_0^1 x^2 \, dx = \frac{1}{3}, \quad \left\| \frac{\partial f}{\partial \theta} \right\|_2.$$

Scientific notation 1.234×10^{-5} , uncertainty $1.23(4)$, and compound units $9.81 \, \text{m s}^{-2}$.

Theorem 1. *If $x > 0$, then $x^2 > 0$.*

Proof. Multiplication of two positive numbers is positive. □

Lemma 2. *For all real x , $(x + 1)^2 \geq 0$.*

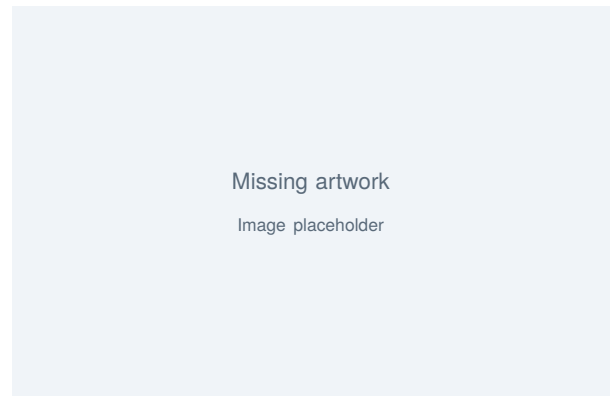

6 Tables and paired artwork

Table 2. Flexible text columns, grouped headers, and emphasis helpers.

		Illustrative scores	
Method	Explanation	First	Second
Baseline	A paragraph-length cell wraps within the available width.	81	<u>89</u>
Candidate	A highlighted row tests the palette and bold emphasis.	93	88

(a) Existing artwork.

(b) Fallback placeholder.

Figure 3. Two panels exercise artwork sizing, fallback handling, subcaptions, and a deliberately extended caption that wraps across multiple lines while remaining aligned with the report text. Both panels should remain within one figure and retain their own reference anchors.

Panel references: figures 3a and 3b and a.

7 Continuation stress cases

Important limitation

All measurements are synthetic. This suite validates typesetting, not scientific claims. *[Replace with your own evidence.]*

Checkpoint 18. This deliberately repeated paragraph verifies that a breakable callout continues across pages without clipping its text or losing its colored rule. Nested content includes an inline equation $r_i = i/n$ and a

Multipage note (continued)

reference to equation (1).

Checkpoint 19. This deliberately repeated paragraph verifies that a breakable callout continues across pages without clipping its text or losing its colored rule. Nested content includes an inline equation $r_i = i/n$ and a reference to equation (1).

Checkpoint 20. This deliberately repeated paragraph verifies that a breakable callout continues across pages without clipping its text or losing its colored rule. Nested content includes an inline equation $r_i = i/n$ and a reference to equation (1).

Checkpoint 21. This deliberately repeated paragraph verifies that a breakable callout continues across pages without clipping its text or losing its colored rule. Nested content includes an inline equation $r_i = i/n$ and a reference to equation (1).

Checkpoint 22. This deliberately repeated paragraph verifies that a breakable callout continues across pages without clipping its text or losing its colored rule. Nested content includes an inline equation $r_i = i/n$ and a reference to equation (1).

Checkpoint 23. This deliberately repeated paragraph verifies that a breakable callout continues across pages without clipping its text or losing its colored rule. Nested content includes an inline equation $r_i = i/n$ and a reference to equation (1).

Checkpoint 24. This deliberately repeated paragraph verifies that a breakable callout continues across pages without clipping its text or losing its colored rule. Nested content includes an inline equation $r_i = i/n$ and a reference to equation (1).

7.1 Continued algorithm

Algorithm 2. Filter and aggregate, first part.

Input: Sequence x

Output: Sum of positive values

```

1 function PositiveSum( $x$ )
2    $s \leftarrow 0$ 
3   for all  $v \in x$  do
4     if  $v > 0$  then
5        $s \leftarrow s + v$ 
6     else
7       continue
8     end if
9   end for
```

Algorithm 2. Continued

```
10  return s
11  end function
```

7.2 External and long listings

Inline code: `sum(values)`.

Listing 2. Bundled executable example.

```
1  def sample_mean(values):
2      """Return the mean of a nonempty sequence."""
3      if not values:
4          raise ValueError("At least one value is required")
5      return sum(values) / len(values)
```

Listing 3. Multipage listing with long-line wrapping.

[illegible]

```

Appendix A Coverage and interpretation

The suite covers report-oriented LaTeX and Tempus commands. Separate fixtures exercise mutually exclusive title and option configurations. Appendix headings are explicit, while section references and contents use alphabetic numbering. Equations, tables, figures, algorithms, and listings receive appendix-scoped numbers.

A.1 Supplementary calculation

$$\sum_{i=1}^n i = \frac{n(n+1)}{2}. \quad (\text{A.1})$$

Table A.1. Supplementary values.

n	Sum
3	6
4	10

Figure A.1. Supplementary test artwork.

Algorithm A.1. Supplementary total.

```
1 return n(n + 1)/2
```

Listing A.1. Supplementary calculation.

```
1 def triangular(n):
2     return n * (n + 1) // 2
```

Appendix B Additional validation notes

Appendix A contains supplementary evidence. Its objects are equation (A.1), table A.1, figure A.1, algorithm A.1, and listing A.1. The appendix subsection is appendix A.1.

$$\sum_{i=1}^n 1 = n. \tag{B.1}$$

The counter restarts in each appendix: equation (B.1) is numbered B.1 rather than continuing the A series.

Unnumbered closing note

The missing-image panel is intentional; unresolved references, clipped content, and missing glyphs are not intentional.
